Assignment 4

January 30, 2022

1 Assignment 4: Company Bankruptcy Prediction

MSDS 422 | Kay Quiballo | 01/30/2022

1.1 Research Question

The data were collected from the Taiwan Economic Journal for the years 1999 to 2009. Company bankruptcy was defined based on the business regulations of the Taiwan Stock Exchange. The goal is to predict 'Bankrupt?' from the variables given.

1.2 Requirements

[x] Split the training set into an 80% training and 20% validation set and conduct / improve upon previous EDA. [x] Build at least three models: an SVM, a logistic regression model, a Naïve Bayes model. [x] Evaluate each of the models' assumptions. [x] Conduct hyperparameter tuning for the SVM kernel. [x] Evaluate goodness of fit metrics including TPR, FPR, precision, recall, and accuracy on the training and validation sets. [x] Build ROC and Precision / Recall graphs. [x] Evaluate your models' performance on the validation set using the F1-score. [x] Python scikit-learn should be your primary environment for conducting this research.

```

For model assumptions, we want to make sure the data is independent and identically distributed. One way to do this is to make sure we choose variables that aren't correlated to remove collinearity. We choose the highly correlated variables (both positive and negative) with 'Bankrupt?' but make sure that they aren't highly correlated with each other.

Split the training set into an 80% training and 20% validation set and conduct / improve upon previous EDA.

```
[7]: plt.hist(data["Bankrupt?"])
from collections import Counter
Counter(data["Bankrupt?"])
```

[7]: Counter({1: 220, 0: 6599})

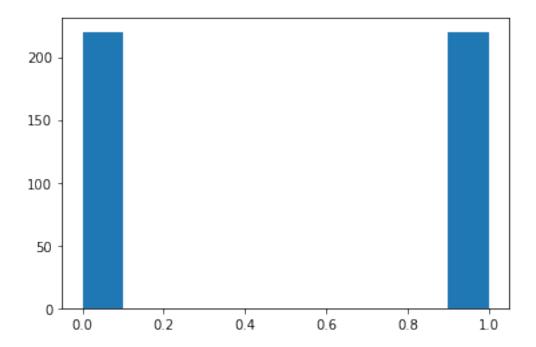

The data mostly indicates that most records do not go bankrupt. We will use stratefied sampling to make sure that this population is not overrepresented in the models. The methodology from this code is taken from Ginelle D'Souza's analysis of this data.

```
[8]: #adjust for over/undersampling
     # Shuffle the Dataset.
     shuffled_df = data.sample(frac=1,random_state=4)
     # Put all the fraud class in a separate dataset.
     y_1 = shuffled_df.loc[shuffled_df['Bankrupt?'] == 1]
     #Randomly select 492 observations from the non-fraud (majority class)
     y_0 = shuffled_df.loc[shuffled_df['Bankrupt?'] == 0].
     ⇒sample(n=220,random_state=42)
     # Concatenate both dataframes again
     normalized_df = pd.concat([y_1, y_0])
     X = normalized_df.drop('Bankrupt?', axis=1)
     y = normalized_df['Bankrupt?']
     x_train, x_test, y_train, y_test = train_test_split(X, y, stratify=y,__
     →random_state=42, test_size=0.2)
     #show new data
     plt.hist(normalized_df["Bankrupt?"])
     from collections import Counter
```

```
Counter(normalized_df["Bankrupt?"])
```

[8]: Counter({1: 220, 0: 220})

Build at least three models: an SVM, a logistic regression model, a Naïve Bayes model.

recall f1-score

Analysis of F1-score: Based on the 3 models created, logistic regression does significantly better than SVM and naive bayes. With the highest value being 1 and the lowest value being 0, this shows that there is room for improvement when it comes to balancing precision and recall. When first running this analysis, the SMOTE function was not used yielding lopsided data and even lower F1-scores. Rerunning with the SMOTE function yielded higher F1-values. Let us examine the precision and recall curves to see where we can improve the models.

Build ROC and Precision / Recall graphs

```
[13]: #SVM
     y_score = model1.predict_proba(x_test)[:, 1]
     fpr, tpr, thresholds = roc_curve(y_test, y_score)
     fig = px.area(
         x=fpr, y=tpr,
         title=f'ROC Curve (AUC={auc(fpr, tpr):.4f})',
         labels=dict(x='False Positive Rate', y='True Positive Rate'),
         width=700, height=500
     fig.add shape(
         type='line', line=dict(dash='dash'),
         x0=0, x1=1, y0=0, y1=1
     )
     fig.update_yaxes(scaleanchor="x", scaleratio=1)
     fig.update_xaxes(constrain='domain')
     fig.show()
      precision, recall, thresholds = precision_recall_curve(y_test, y_score)
     fig = px.area(
         x=recall, y=precision,
         title=f'Precision-Recall Curve (AUC={auc(fpr, tpr):.4f})',
         labels=dict(x='Recall', y='Precision'),
         width=700, height=500
     fig.add_shape(
         type='line', line=dict(dash='dash'),
         x0=0, x1=1, y0=1, y1=0
     fig.update_yaxes(scaleanchor="x", scaleratio=1)
     fig.update_xaxes(constrain='domain')
     fig.show()
     y_score = model2.predict_proba(x_test)[:, 1]
```

```
[14]: #logistic regression
y_score = model2.predict_proba(x_test)[:, 1]
fpr, tpr, thresholds = roc_curve(y_test, y_score)

fig = px.area(
    x=fpr, y=tpr,
    title=f'ROC Curve (AUC={auc(fpr, tpr):.4f})',
    labels=dict(x='False Positive Rate', y='True Positive Rate'),
    width=700, height=500
```

```
fig.add_shape(
    type='line', line=dict(dash='dash'),
    x0=0, x1=1, y0=0, y1=1
fig.update_yaxes(scaleanchor="x", scaleratio=1)
fig.update_xaxes(constrain='domain')
fig.show()
precision, recall, thresholds = precision_recall_curve(y_test, y_score)
fig = px.area(
    x=recall, y=precision,
    title=f'Precision-Recall Curve (AUC={auc(fpr, tpr):.4f})',
    labels=dict(x='Recall', y='Precision'),
    width=700, height=500
fig.add_shape(
    type='line', line=dict(dash='dash'),
    x0=0, x1=1, y0=1, y1=0
fig.update_yaxes(scaleanchor="x", scaleratio=1)
fig.update_xaxes(constrain='domain')
fig.show()
```

Analysis of precision-recall curves: from all SVM and naive bayes graphs, the precision-recall curves indicate that there is high precision with a trade off of very low recall. And vice-versa, there is a high recall with a trade of of low precision. There is not quite a balance, and perhaps tuning the models using a different scoring method will improve the precision-recall graphs. On the other hand, the logistic regression does a great job of having high precision and accuracy without needing to trade off too much of one or the other.

Overall, the logistic regression model does the best job in terms of accuracy and precision to predict if the data will go bankrupt with an f-score of 0.89
